

Reading and Writing Data

readr and haven

1/29/23

readr

| Function | Reads |
|---------------------------|----------------------------|
| <code>read_csv()</code> | Comma separated values |
| <code>read_csv2()</code> | Semi-colon separate values |
| <code>read_delim()</code> | General delimited files |
| <code>read_fwf()</code> | Fixed width files |
| <code>read_log()</code> | Apache log files |
| <code>read_table()</code> | Space separated files |
| <code>read_tsv()</code> | Tab delimited values |

Importing Data

```
1 dataset <- read_csv("file_name.csv")  
2 dataset
```

R functions

```
x <- f(arg = 1)
```

R functions

x <- f(arg = 1)

function
name

A diagram consisting of a vertical line extending upwards from the word 'function' and a horizontal line extending to the right from that vertical line, ending with an arrowhead pointing at the orange 'f' in the code snippet above.

arguments

A diagram consisting of a vertical line extending upwards from the word 'arguments' and a horizontal line extending to the left from that vertical line, ending with an arrowhead pointing at the opening parenthesis '(' in the code snippet above.

R functions

*this saves it in your
global environment*

x <- f(arg = 1)

assign
results of
f() to x

the name of
your results

Your Turn 1

Find **diabetes.csv** on your computer. Then read it into an object. Then view the results.

```
1 diabetes <- read_csv("diabetes.csv")
```

new data alert!

diabetes

| | id | chol | stab.glu | hdl | ratio | glyhb | location | age | gender | height | weight | frame | bp. |
|----|------|------|----------|-----|-------|-------|------------|-----|--------|--------|--------|--------|-----|
| 1 | 1000 | 203 | 82 | 56 | 3.6 | 4.31 | Buckingham | 46 | female | 62 | 121 | medium | 118 |
| 2 | 1001 | 165 | 97 | 24 | 6.9 | 4.44 | Buckingham | 29 | female | 64 | 218 | large | 112 |
| 3 | 1002 | 228 | 92 | 37 | 6.2 | 4.64 | Buckingham | 58 | female | 61 | 256 | large | 190 |
| 4 | 1003 | 78 | 93 | 12 | 6.5 | 4.63 | Buckingham | 67 | male | 67 | 119 | large | 110 |
| 5 | 1005 | 249 | 90 | 28 | 8.9 | 7.72 | Buckingham | 64 | male | 68 | 183 | medium | 138 |
| 6 | 1008 | 248 | 94 | 69 | 3.6 | 4.81 | Buckingham | 34 | male | 71 | 190 | large | 132 |

Where does it come from?
diabetes.csv (etc)
study: diabetes in
African Americans

How can I use it?

```
diabetes <-  
readr::read_csv("diabetes.csv")  
View(diabetes)
```

this saves it in your
global environment

1 diabetes

```
# A tibble: 403 × 19
```

| | id | chol | stab.glu | hdl | ratio | glyhb | location | age |
|----|--|-------|----------|-------|-------|-------|------------|-------|
| | <dbl> | <dbl> | <dbl> | <dbl> | <dbl> | <dbl> | <chr> | <dbl> |
| 1 | 1000 | 203 | 82 | 56 | 3.60 | 4.31 | Buckingham | 46 |
| 2 | 1001 | 165 | 97 | 24 | 6.90 | 4.44 | Buckingham | 29 |
| 3 | 1002 | 228 | 92 | 37 | 6.20 | 4.64 | Buckingham | 58 |
| 4 | 1003 | 78 | 93 | 12 | 6.5 | 4.63 | Buckingham | 67 |
| 5 | 1005 | 249 | 90 | 28 | 8.90 | 7.72 | Buckingham | 64 |
| 6 | 1008 | 248 | 94 | 69 | 3.60 | 4.81 | Buckingham | 34 |
| 7 | 1011 | 195 | 92 | 41 | 4.80 | 4.84 | Buckingham | 30 |
| 8 | 1015 | 227 | 75 | 44 | 5.20 | 3.94 | Buckingham | 37 |
| 9 | 1016 | 177 | 87 | 49 | 3.60 | 4.84 | Buckingham | 45 |
| 10 | 1022 | 263 | 89 | 40 | 6.60 | 5.78 | Buckingham | 55 |
| # | with 302 more rows and 11 more variables | | | | | | | |

Tibbles

`data.frames` are the basic form of rectangular data in R (columns of variables, rows of observations)

`read_csv()` reads the data into a `tibble`, a modern version of the data frame.

a tibble is a data frame

Missing values

It's common to use codes for missing values (-99, 8888)

The na option can change these values to NA

```
1 read_csv(  
2   "a,b,c,d  
3   1,-99,3,4  
4   5,6,-99,8",  
5   na = "-99"  
6 )
```

```
# A tibble: 2 × 4
```

| | a | b | c | d |
|---|-------|-------|-------|-------|
| | <dbl> | <dbl> | <dbl> | <dbl> |
| 1 | 1 | NA | 3 | 4 |
| 2 | 5 | 6 | NA | 8 |

Parsing data types

The read functions in readr try to *guess* each data type, but sometimes it's *wrong*

To tell readr how to parse the columns, add the argument **col_types** to `read_csv()`

```
1 diabetes <- read_csv(  
2   "diabetes.csv",  
3   col_types = list(id = col_character())  
4 )
```

Parsing data types

Or use a string for
each variable

```
type: col_type  
= "cci"
```

Parsing data types

Or use a string for
each variable
type: col_type =
"cci"

| letter | type |
|--------|-----------------|
| c | character |
| i | integer |
| n | number |
| d | double |
| l | logical |
| D | date |
| T | date time |
| t | time |
| ? | guess the type |
| _ or - | skip the column |

Your Turn 2

Set the 4 column types to be: integer, double, character, and unknown (guess)

```
1 read_csv(  
2     "a,b,c,d  
3     1,2,3,4  
4     5,6,7,8",  
5     col_types = ""  
6 )
```

Your Turn 2

Set the 4 column types to be: integer, double, character, and unknown (guess)

```
1 read_csv(  
2   "a,b,c,d  
3   1,2,3,4  
4   5,6,7,8",  
5   col_types = "idc?"  
6 )
```

```
# A tibble: 2 × 4  
      a      b c      d  
  <int> <dbl> <chr> <dbl>  
1     1     2 3     4  
2     5     6 7     8
```

| Function | Software |
|---------------------------|----------|
| <code>read_sas()</code> | SAS |
| <code>read_xpt()</code> | SAS |
| <code>read_spss()</code> | SPSS |
| <code>read_sav()</code> | SPSS |
| <code>read_por()</code> | SPSS |
| <code>read_stata()</code> | Stata |
| <code>read_dta()</code> | Stata |

Heads up!

haven is *not* a core member of the tidyverse.
That means you need to load it with
`library(haven)`.

Your Turn 3

There are several versions of the diabetes file besides CSV. Pick a file format you or your colleagues use and import them using the corresponding function from haven.

Your Turn 3

```
1 library(haven)
2 diabetes <- read_sas("diabetes.sas7bdat")
```

Your Turn 3

1 diabetes

```
# A tibble: 403 × 19
  id chol stab_glu hdl ratio glyhb location age
  <dbl> <dbl>   <dbl> <dbl> <dbl> <dbl> <chr>   <dbl>
1  1000   203     82    56  3.60  4.31 Buckingham 46
2  1001   165     97    24  6.90  4.44 Buckingham 29
3  1002   228     92    37  6.20  4.64 Buckingham 58
4  1003    78     93    12  6.5   4.63 Buckingham 67
5  1005   249     90    28  8.90  7.72 Buckingham 64
6  1008   248     94    69  3.60  4.81 Buckingham 34
7  1011   195     92    41  4.80  4.84 Buckingham 30
8  1015   227     75    44  5.20  3.94 Buckingham 37
9  1016   177     87    49  3.60  4.84 Buckingham 45
10 1022   263     89    40  6.60  5.78 Buckingham 55
"
```

Writing data

| Function | Writes |
|--------------------------------|--|
| <code>write_csv()</code> | Comma separated values |
| <code>write_excel_csv()</code> | CSV that you plan to open in Excel |
| <code>write_delim()</code> | General delimited files |
| <code>write_file()</code> | A single string, written as is |
| <code>write_lines()</code> | A vector of strings, one string per line |
| <code>write_tsv()</code> | Tab delimited values |
| <code>write_rds()</code> | A data type used by R to save objects |
| <code>write_sas()</code> | SAS .sas7bdat files |
| <code>write_xpt()</code> | SAS transport format, .xpt |

| Function | Writes |
|----------------------------|------------------|
| <code>write_sav()</code> | SPSS .sav files |
| <code>write_stata()</code> | Stata .dta files |

Writing data

```
1 write_csv(diabetes, file = "diabetes-clean.csv")
```

Your Turn 4

R has a few data file types, such as RDS and .Rdata. Save **diabetes** as **"diabetes.Rds"**.

```
1 write_rds(diabetes, "diabetes.Rds")
```
