Reading and Writing Data readr and haven

2024-08-13

readr

| Function | Reads |
|--------------|----------------------------|
| read_csv() | Comma separated values |
| read_csv2() | Semi-colon separate values |
| read_delim() | General delimited files |
| read_fwf() | Fixed width files |
| read_log() | Apache log files |
| read_table() | Space separated files |
| read_tsv() | Tab delimited values |

Importing Data

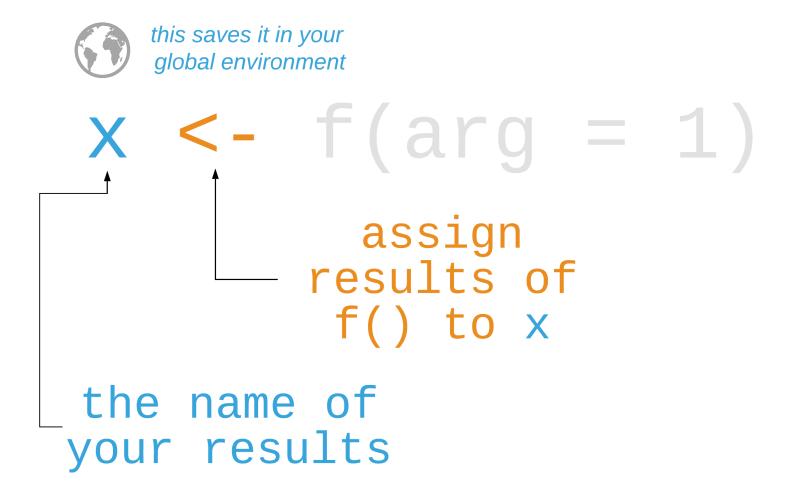

```
1 dataset <- read_csv("file_name.csv")
2 dataset</pre>
```

R functions

$$x < - f(arg = 1)$$

R functions

R functions

Find diabetes.csv on your computer. Then read it into an object. Then view the results.

Find diabetes.csv on your computer. Then read it into an object. Then view the results.

```
1 diabetes <- read_csv("diabetes.csv")</pre>
```

Where does it come from?
diabetes.csv (etc)
study: diabetes in
African Americans

How can I use it?

diabetes < readr::read_csv("diabetes.csv")
View(diabetes)</pre>

this saves it in your global environment

1 diabetes

Tibbles

data.frames are the basic form of rectangular data in R (columns of variables, rows of observations) read_csv() reads the data into a tibble, a modern version of the data frame.

Missing values

It's common to use codes for **missing values** (-99, 9999)

The na option can change these values to NA

```
1 read_csv(
2   "a,b,c,d
3   1,-99,3,4
4   5,6,-99,8",
5   na = "-99"
6 )

# A tibble: 2 × 4
   a  b  c  d
  <dbl> <dbl> <dbl><</pre>
```

1 NA 3 4

2 5 6 NA 8

Parsing data types

The read functions in readr try to *guess* each data type, but sometimes it's *wrong*

To tell readr how to parse the columns, add the argument **col_types** to read_csv()

```
1 diabetes <- read_csv(
2   "diabetes.csv",
3   col_types = list(id = col_character())
4 )</pre>
```

Parsing data types

Or use a string for each variable type: col_type

= "cci"

Parsing data types

Or use a string for each variable type: col_type = "cci"

| letter | type |
|--------|-----------------|
| С | character |
| i | integer |
| n | number |
| d | double |
| 1 | logical |
| D | date |
| Т | date time |
| t | time |
| ? | guess the type |
| _ or - | skip the column |

Set the 4 column types to be: integer, double, character, and unknown (guess)

```
1 read_csv(
2   "a,b,c,d
3   1,2,3,4
4   5,6,7,8",
5   col_types = ""
6 )
```

Set the 4 column types to be: integer, double, character, and unknown (guess)

```
1 read_csv(
2   "a,b,c,d
3   1,2,3,4
4   5,6,7,8",
5   col_types = "idc?"
6 )

# A tibble: 2 × 4
        a   b   c   d
        <int> <dbl> <chr>        <dbl> <chr>        <dbl> 1   2   3   4
```

haven

| Function | Software |
|--------------|----------|
| read_sas() | SAS |
| read_xpt() | SAS |
| read_spss() | SPSS |
| read_sav() | SPSS |
| read_por() | SPSS |
| read_stata() | Stata |
| read_dta() | Stata |

Heads up!

haven is *not* a core member of the tidyverse. That means you need to load it with library (haven).

There are several versions of the diabetes file besides CSV. Pick a file format you or your colleagues use and import them using the corresponding function from haven.

```
1 library(haven)
2 diabetes <- read_sas("diabetes.sas7bdat")</pre>
```

1 diabetes

```
# A tibble: 403 × 19
      id chol stab glu
                           hdl ratio glyhb location

Writing data

| Function | Writes |
|------------------------------|--|
| write_csv() | Comma separated values |
| <pre>write_excel_csv()</pre> | CSV that you plan to open in Excel |
| <pre>write_delim()</pre> | General delimited files |
| write_file() | A single string, written as is |
| write_lines() | A vector of strings, one string per line |
| write_tsv() | Tab delimited values |
| write_rds() | A data type used by R to save objects |
| write_xpt() | SAS transport format, .xpt |
| write_sas() | SAS .sas7bdat files (experimental) |

| Function | Writes | | |
|---------------|------------------|--|--|
| write_sav() | SPSS .sav files | | |
| write_stata() | Stata .dta files | | |

Writing data

```
1 write_csv(diabetes, file = "diabetes-clean.csv")
```

R has a few data file types, such as RDS and .Rdata. Save diabetes as "diabetes .Rds".

R has a few data file types, such as RDS and .Rdata. Save diabetes as "diabetes .Rds".

```
1 write_rds(diabetes, "diabetes.Rds")
```
